

CLAIMS

What is claimed is:

- 1 1. A slider assembly, comprising:
2 a slider having a magnetic head for reading and/or writing to a storage medium;
3 and
4 a vibration absorber operatively coupled to the slider for reducing mechanical
5 vibrations of the slider caused by contact of the slider with the storage
6 medium.

- 1 2. A slider assembly as recited in claim 1, wherein the vibration absorber includes a
2 coupling portion coupled to the slider, and a weight coupled to the coupling
3 portion by a resiliently deformable flexure member.

- 1 3. A slider assembly as recited in claim 2, wherein the weight is positioned towards
2 a trailing edge of the slider.

- 1 4. A slider assembly as recited in claim 2, wherein the weight is positioned towards
2 a leading edge of the slider.

- 1 5. A slider assembly as recited in claim 2, further comprising a second weight
2 coupled to the coupling portion.

- 1 6. A slider assembly as recited in claim 5, wherein the weight and second weight are
2 positioned towards a leading and trailing edge of the slider, respectively.
- 1 7. A slider assembly as recited in claim 5, wherein the weight and second weight are
2 positioned towards opposite edges of the slider, the opposite edges extending
3 between trailing and leading edges of the slider.
- 1 8. A slider assembly as recited in claim 2, wherein a pivot axis of the flexure
2 member is about parallel to an air bearing surface of the slider.
- 1 9. A slider assembly as recited in claim 2, wherein the weight has a flat profile,
2 wherein a plane of the weight along the profile is oriented at an angle with respect
3 to an air bearing surface of the slider.
- 1 10. A slider assembly as recited in claim 2, wherein the flexure member allows the
2 weight to twist about an axis of the flexure member.
- 1 11. A slider assembly as recited in claim 2, wherein the weight is an integral part of
2 the flexure member.

1 12. A slider assembly as recited in claim 1, wherein the vibration absorber is tuned to
2 about match a natural frequency of vibration of the slider when the slider is in a
3 flying state.

1 13. A slider assembly as recited in claim 1, wherein the vibration absorber is damped.

1 14. A slider assembly as recited in claim 13, wherein the damped vibration absorber
2 is tuned to a frequency lower than a natural frequency of vibration of the slider
3 when the slider is in a flying state.

1 15. A magnetic storage system, comprising:
2 a magnetic disk;
3 at least one head for reading from and writing to the magnetic disk;
4 a slider for supporting the head;
5 an actuator arm and suspension for supporting the slider;
6 a vibration absorber for reducing mechanical vibrations of the slider caused by
7 contact of the slider with the magnetic media; and
8 a control unit coupled to the head for controlling operation of the head.

1 16. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 is coupled to the slider.

- 1 17. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 is coupled to the suspension.
- 1 18. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 is coupled to the actuator arm.
- 1 19. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 includes a coupling portion coupled to the slider, and a weight coupled to the
3 coupling portion by a resiliently deformable flexure member.
- 1 20. A magnetic storage system as recited in claim 19, wherein the weight is
2 positioned towards a trailing edge of the slider.
- 1 21. A magnetic storage system as recited in claim 19, wherein the weight is
2 positioned towards a leading edge of the slider.
- 1 22. A magnetic storage system as recited in claim 19, further comprising a second
2 weight coupled to the coupling portion.
- 1 23. A magnetic storage system as recited in claim 22, wherein the weight and second
2 weight are positioned towards a leading and trailing edge of the slider,
3 respectively.

1 24. A magnetic storage system as recited in claim 22, wherein the weight and second
2 weight are positioned towards opposite edges of the slider, the opposite edges
3 extending between trailing and leading edges of the slider.

1 25. A magnetic storage system as recited in claim 19, wherein a pivot axis of the
2 flexure member is about parallel to an air bearing surface of the slider.

1 26. A magnetic storage system as recited in claim 19, wherein the weight has a flat
2 profile, wherein a plane of the weight along the profile is oriented at an angle with
3 respect to an air bearing surface of the slider.

1 27. A magnetic storage system as recited in claim 19, wherein the weight is an
2 integral part of the flexure member.

1 28. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 is tuned to about match a natural frequency of vibration of the slider when the
3 slider is in a flying state.

1 29. A magnetic storage system as recited in claim 15, wherein the vibration absorber
2 is damped.

1 30. A magnetic storage system as recited in claim 29, wherein the damped vibration
2 absorber is tuned to a frequency lower than a natural frequency of vibration of the
3 slider when the slider is in a flying state.

1 31. A magnetic storage system, comprising:
2 a magnetic disk;
3 at least one head for reading from and writing to the magnetic disk;
4 a slider for supporting the head;
5 an actuator arm and suspension for supporting the slider;
6 a vibration absorber for reducing mechanical vibrations of the slider caused by
7 contact of the slider with the magnetic media; wherein the vibration
8 absorber includes a coupling portion operatively coupled to the slider, and
9 a weight coupled to the coupling portion by a resiliently deformable
10 flexure member; and
11 a control unit coupled to the head for controlling operation of the head.

1 32. A magnetic storage system as recited in claim 31, wherein the weight is
2 positioned towards a trailing edge of the slider.
